

Project Executable Files

Date: 29 September 2026

Team No: 05

Project Name: AI WeatherWise

Maximum Marks: 3 Marks

Project Executable Files

This section requires submission of all executable and deployable files for the project. The project files are organized so that the evaluator can run and understand the AI WeatherWise backend using the provided setup instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	Yes
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	NA
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

```
AI-WeatherWise/  
├──  
│   ├── src/  
│   │   ├── config/  
│   │   ├── controllers/  
│   │   ├── middleware/  
│   │   ├── models/  
│   │   ├── routes/  
│   │   └── services/  
│   └──  
│       ├── app.js  
│       ├── server.js  
│       ├── package.json  
│       ├── .env.example  
│       ├── .gitignore  
│       └── README.md
```

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	Not deployed / Local execution
Login Credentials (Demo)	API authentication used; no demo password is included in the document.
Platform / Hosting Provider	Local Development Environment (Node.js / Express.js)
Repository Link	https://github.com/24bsccs46-netizen/TN-NM-AI-augmented-backend-project
Demo Video Link	https://drive.google.com/file/d/1GDHxgW_TLZz6yltx9JuNTxPIOBYX6EG0/view?usp=sh

Security note: Actual API keys, database passwords, and JWT secrets are stored in the local .env configuration and are not included in the public repository.

Step 4: Run Instructions

1. Install Node.js (v16 or later) and npm on the system.
2. Download or clone the AI WeatherWise project repository.
3. Open the project folder in Visual Studio Code.
4. Open a terminal in the project folder and install dependencies using npm install.
5. Create and configure the .env file with the required MongoDB URI, JWT secret, PORT, weather API key, and Gemini API key.
6. Start the backend using the project start/development command configured in package.json.
7. Verify that MongoDB connects successfully and that the Express server starts on the configured port.
8. Test the available REST API endpoints using Thunder Client or another API client.
9. Use the Register, Login, Weather, and Recommendation endpoints to verify the backend workflow.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Application currently runs mainly in a local development environment.	Can be deployed to a cloud platform in future.
2	AI response depends on the availability and access of the third-party AI service/API.	Implement fallback logic or provide a local AI model as a backup.
3	Weather information depends on the availability of the third-party weather API and external service availability.	Check for alternative weather APIs and implement caching.
4	Performance may vary depending on system resources and AI model response time.	Dedicated server for AI processing and optimization can be implemented.
5	The current project is a headless backend and does not include a frontend interface.	A dedicated frontend interface can be added in future.
