

User Acceptance Testing (UAT) Template

Date	29 September 2026
Team ID	SWTID-2026-9139
Project Name	AI WeatherWise
Maximum Marks	As per provided template

Project Overview:

Project Name: AI WeatherWise

Project Description: AI WeatherWise is a RESTful backend built using Node.js and Express.js with MongoDB/Mongoose. It provides user authentication, current weather retrieval, favorite-location management and weather-based recommendations.

Project Version: v1.0

Testing Period: 29 September 2026

Testing Scope:

- User registration and authentication
- User login and JWT authentication
- Current weather retrieval for a city
- Weather-based recommendation endpoint
- API response status and basic functional behaviour

User Stories / Requirements Tested:

- A user can register an account.
- A registered user can log in securely.
- A user can request current weather information for a location.
- A user can request a weather-based recommendation.

Testing Environment:

URL/Location: Local backend API — <http://localhost:5001>

Testing Tool: Thunder Client in Visual Studio Code

Credentials: Test account used for API testing; password and JWT token are not included in this document.

Test Cases:

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	User Registration	1. Open POST /api/auth/register 2. Enter valid test user details 3. Send request	Account should be created successfully and API should return a successful creation response.	API returned HTTP 201 Created and registration completed successfully.	PASS
TC-002	User Login	1. Open POST /api/auth/login 2. Enter registered credentials 3. Send request	Valid credentials should authenticate the user and return a JWT token.	API returned HTTP 200 OK and login returned a JWT token.	PASS
TC-003	Weather Retrieval — Chennai	1. Open GET /api/weather/chennai 2. Send request	The API should retrieve current weather information for Chennai and return a successful response.	API returned HTTP 200 OK with weather response data for Chennai.	PASS
TC-004	Weather Recommendation	1. Open POST /api/ai/weather-recommendation 2. Provide the required weather input 3. Send request	The recommendation endpoint should return a weather-based recommendation response.	API returned HTTP 200 OK with the fallback recommendation response because the external AI service was unavailable.	PASS

User Acceptance Testing (UAT) — AI WeatherWise

Bug Tracking:

Bug ID	Bug Description	Steps to reproduce	Severity	Status	Additional feedback
BG-001	No functional bug was encountered during the four executed API test cases.	Not applicable.	N/A	No bug reported	Recommendation endpoint used fallback behaviour because the external AI service was unavailable; the API still returned HTTP 200.

UAT Test Summary:

All four executed API test cases passed based on the observed responses. The recommendation endpoint demonstrated fallback behaviour when the external AI service was unavailable. No functional bug was recorded during the executed test cases.

Test Evidence:

API testing evidence includes Register API Response, Login API Response, Weather API – Chennai Response and Recommendation API Response screenshots.
